

Automatic model routing for Claude Code and Codex

Install once. Keep writing prompts normally. Calibra classifies each request locally, selects a tier, rewrites the model, and forwards it upstream.

Check prerequisites

Node.js 18+
Claude Code and/or Codex CLI
Configured upstream AI server
For Claude: enterprise wrapper/proxy environment

Install

npx calibra install

Alternative: `npm install -g calibra`
Installer preserves existing tier configuration.

Configure

`export CALIBRA_REMOTE_HOST="gateway.example.com"`

Edit tier models in:
`~/.claude-corp/calibra/calibra-models.json`

Verify

Claude Code: `/calibra status`

Codex: `status calibra`
Plain text - no slash command.

EVERY PROMPT

Use in Claude Code

`/calibra on` - enable routing
`/calibra off` - disable routing
`/calibra toggle` - flip state
`/calibra ml on` - local MiniLM
`/calibra ml off` - heuristic
`/calibra rules` - heuristic alias

Visible result
`calibra: >> claude-sonnet-4-6 . mid`

Use in Codex

`enable calibra`
`disable calibra`
`status calibra`
`turn on calibra`
`turn off calibra`
`calibra ml on`
`calibra ml off`
`calibra rules`

Visible result
`[calibra: model . tier]`

THE FOUR ROUTING TIERS

LIGHT

Recall, social, one mechanical edit

MID

One bounded component with chosen logic

DEEP

Judgment or synthesis in one system

ULTRA

Multiple systems or broad program

Three things to remember

1. Claude and Codex keep separate on/off and engine state. 2. ML is optional; missing model/runtime falls back to heuristics. 3. The installer currently attempts the ~22 MB checksum-verified ONNX download during install.

Upgrade: `npx calibra upgrade` | **Uninstall:** `npx calibra uninstall`
